TRACK A DEMO EVIDENCE

KijaniKiosk release path - screenshot sequence

Dalton Wambui | 2026-11-14 | repository: feature/capstone-track-a

> **What this is:** a sequence of live terminal and Jenkins screenshots captured from the lab environment. It is not a Loom recording. Each page names the claim, the command, and the evidence file.

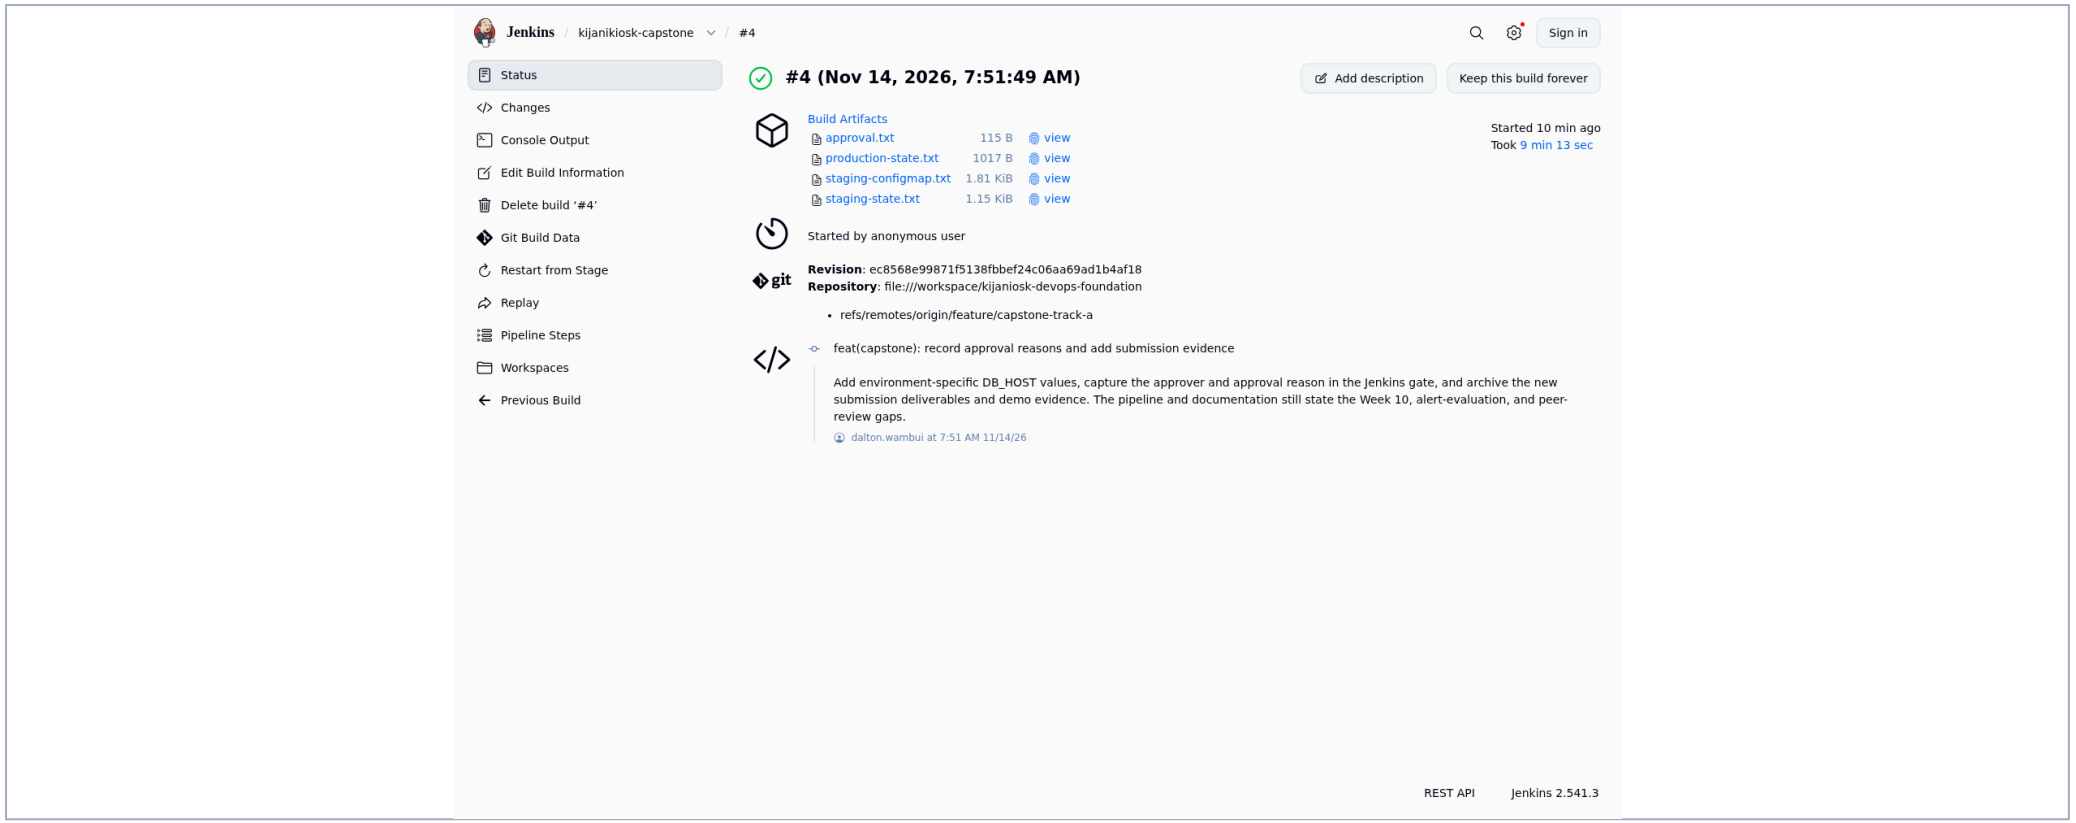

> **Claims covered:** environment separation, version-aware smoke testing, a negative-check failure, pod self-healing, production health, and the Jenkins approval path.

Gaps still shown honestly: Week 10 serverless receipt chain is not implemented; alerts are not evaluated; production is a namespace in the same minikube cluster; peer review is a self-review fallback.

Full logs: `capstone/evidence/demo/` and `capstone/evidence/jenkins-build-4/`.

1. JENKINS PIPELINE

Build #4 completed the staging-to-production path

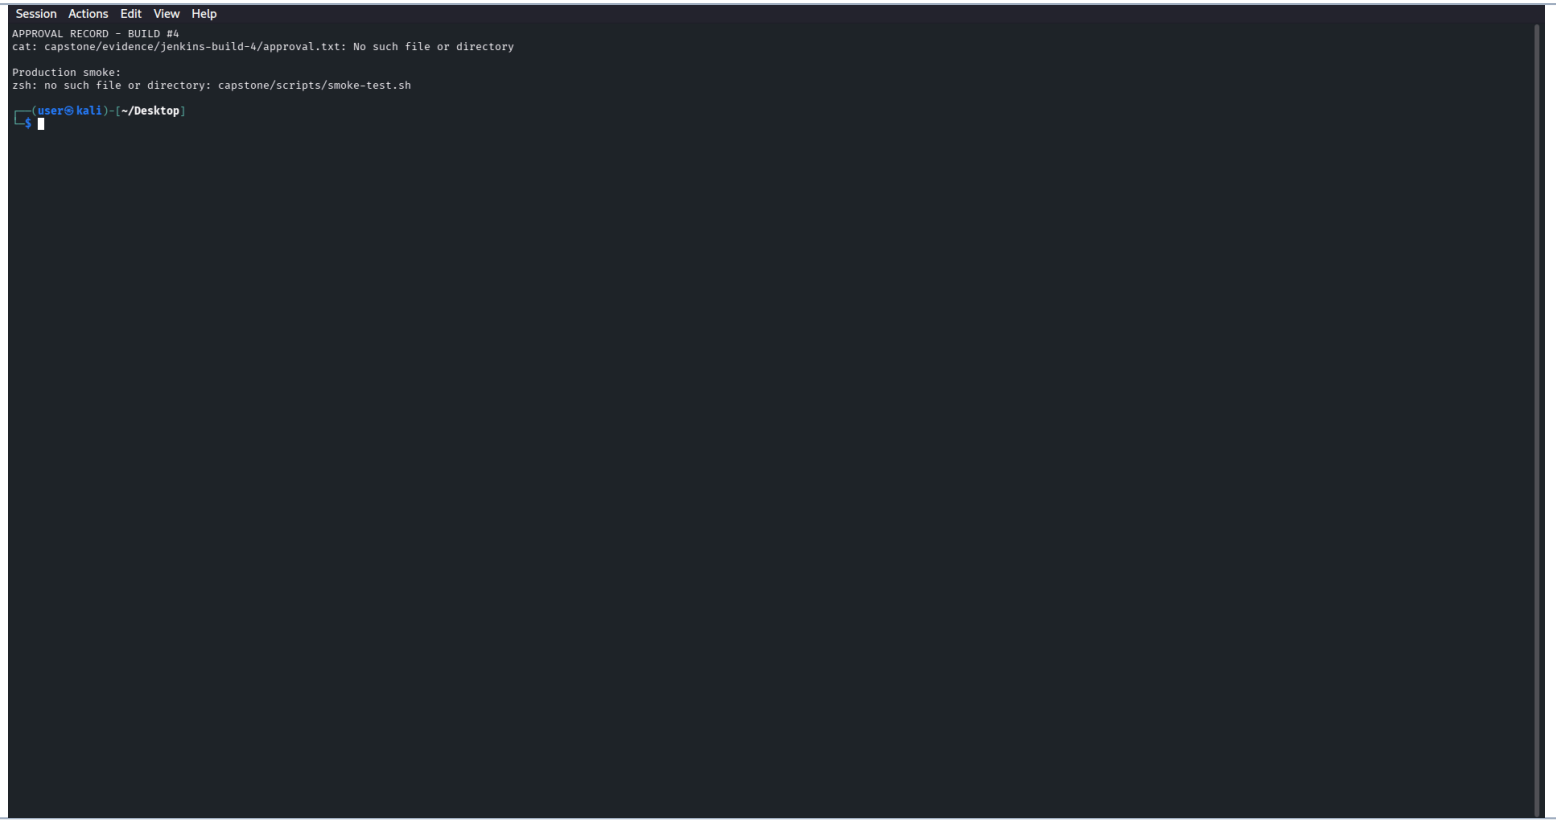

The build page shows the stages that matter: Verify, Build image, Push image, Deploy staging, Smoke test staging, Approve production, Deploy production, and Smoke test production.

```
Smoke test staging: PASS health version 2.4.0-ec8568e
Input requested: Deploy 2.4.0-ec8568e to production?
Production approved by anonymous: Staging smoke passed for 2.4.0-ec8568e; approving production promotion
Smoke test production: PASS health version 2.4.0-ec8568e
Finished: SUCCESS
```

Evidence: `capstone/evidence/jenkins-build-4/console.txt` ; screenshot: `capstone/evidence/screenshots/jenkins-build-4.png` .

2. APPROVAL GATE AND PRODUCTION PROOF

The gate paused, recorded a reason, then production served the same tag

```
approver=anonymous
reason=Staging smoke passed for 2.4.0-ec8568e; approving production promotion
tag=2.4.0-ec8568e

PASS health: {"service": "kk-payments", "status": "ok", "version": "2.4.0-ec8568e"}
PASS total: {"total": 42}
PASS smoke test: kijani-production/kk-payments-service
```

> The reason and tag are recorded. The submitter is `anonymous` because the lab Jenkins has no authentication; that is a real limitation, not a claim of strong authorization.

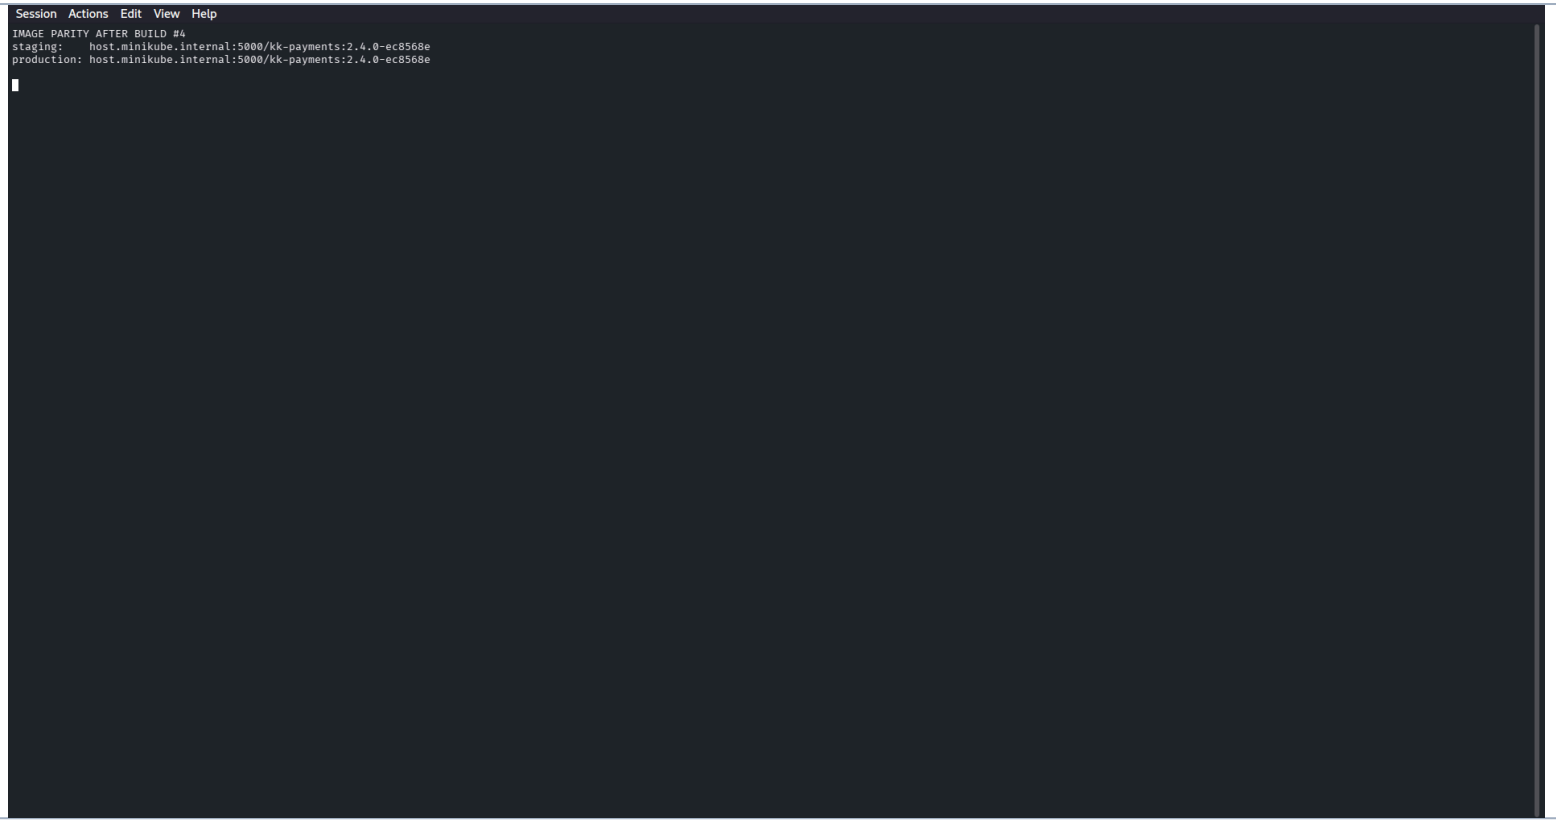

Evidence: `capstone/evidence/jenkins-build-4/approval.txt`; screenshot: `terminal-approval-and-production-smoke.png`.

3. ENVIRONMENT SEPARATION

Same workload, different environment facts

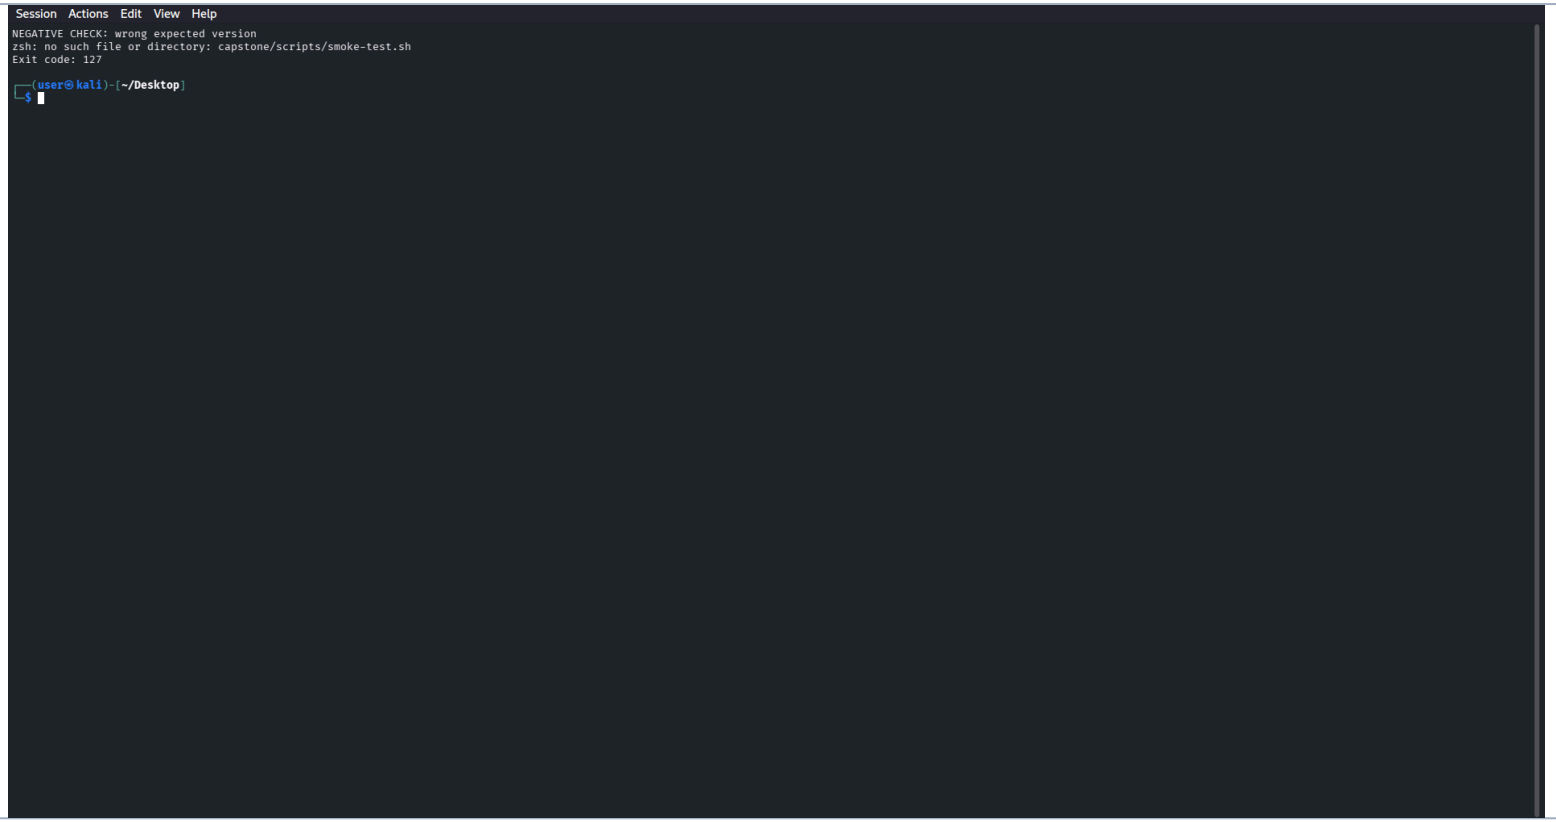

Staging and production render different `DB_HOST`, `NODE_ENV`, `RECEIPTS_BUCKET`, and replica counts. `APP_VERSION` is absent because it belongs to the image, not the ConfigMap.

Evidence: `capstone/evidence/demo/config-render.txt`, `image-parity.txt`; screenshots: `terminal-config.png`, `terminal-image-parity.png`.

4. NEGATIVE CHECK

A wrong expected version must fail, not pass quietly

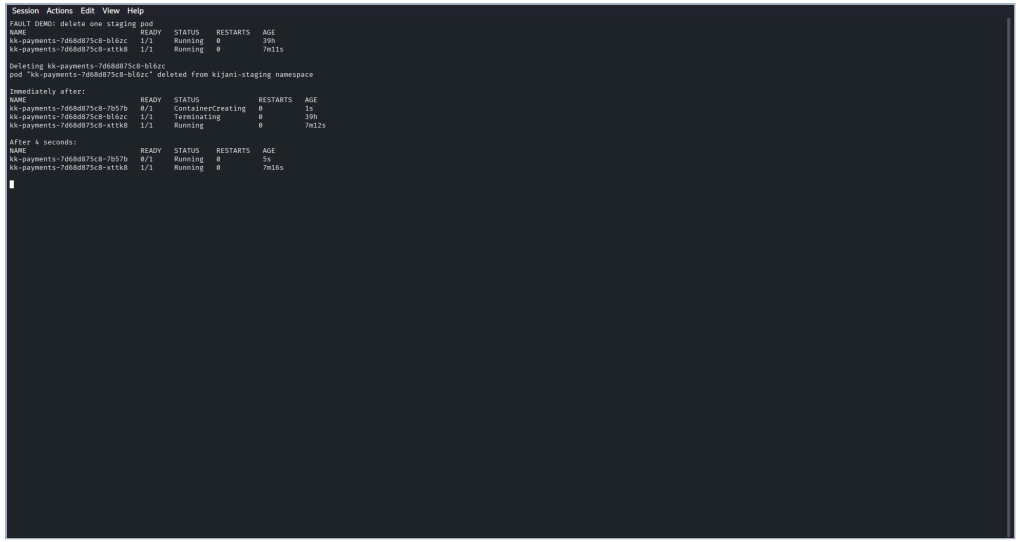

The smoke test exits non-zero and the assertion shows the actual version versus the deliberately wrong expected version. No `PASS` line is printed. This is the guardrail that build #1 exposed as necessary; the screenshot was recaptured after build #4.

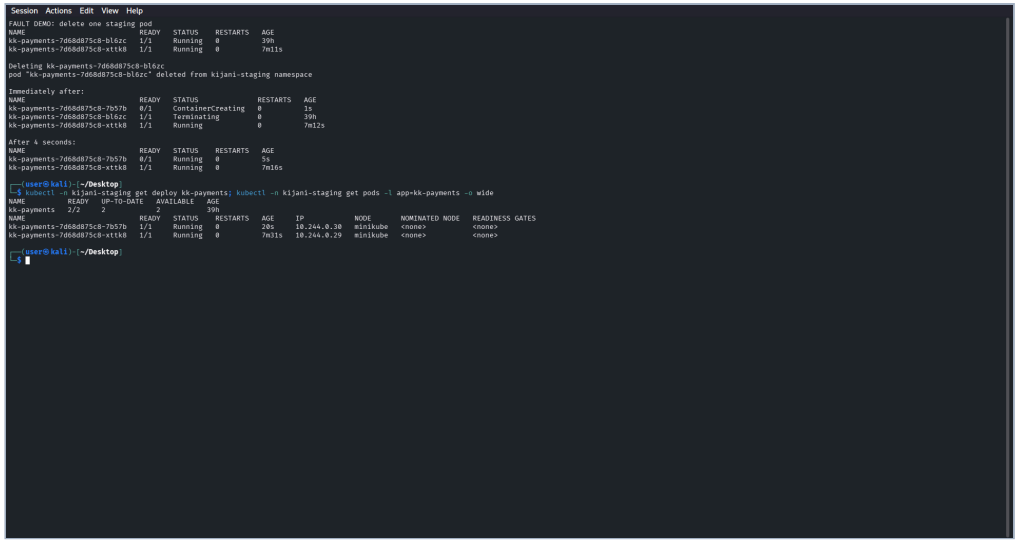

Evidence: `capstone/evidence/demo/negative-smoke.txt`; screenshot: `capstone/evidence/screenshots/terminal-negative-smoke.png`.

5. FAULT HANDLING

Delete a pod; the Deployment replaces it

One pod is Terminating while the replacement is created. The Service still has the other ready pod.

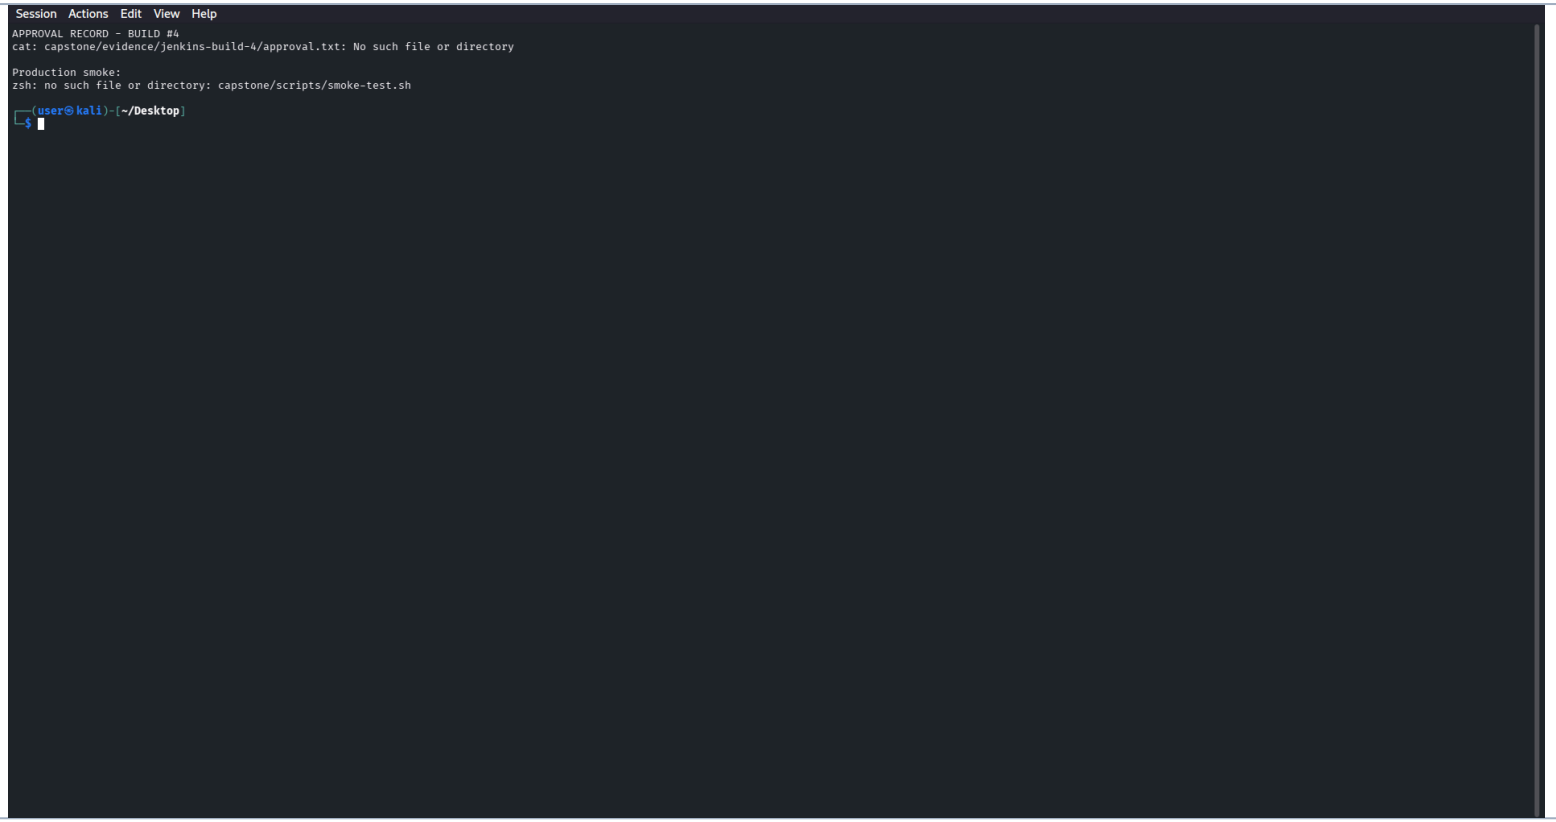

The Deployment returns to 2/2 available without a manual rollout. This is controller self-healing, not a rollback.

Evidence: `capstone/evidence/demo/fault-handling.txt`; screenshots: `terminal-fault-handling.png`, `terminal-fault-handling-after.png`.

6. PRODUCTION PROOF AND HONEST GAPS

Production answers, and the limits are explicit

> **Do not overclaim:** production is a namespace in the same minikube cluster. The PrometheusRule is validated but not evaluated. Week 10 receipt delivery is absent. Jenkins has no authentication, so the submitter is anonymous even though the reason is recorded.

Evidence: `capstone/evidence/demo/` ; claims and commands: `docs/demo-script.md` .
